

A few ideas:

1. Bycatch utilization - 7.3 million metric tons of bycatch are being discarded every year (see new FAO publication for details).
2. Processing plant waste utilization - check model being used by Regal Springs in Honduras - Tilapia processing waste is being converted into feed for shrimp farmers. The opposite scenario can also be implemented whereby shrimp farm processing waste can be used for Tilapia feeds, created a sustainable cycle of protein utilization.
3. Krill - Aker Biomarine, which is a publicly traded company, is banking on this as a solution and has invested millions in new harvesting equipment and boats. (<http://www.akerbiomarine.com/>)

If there is a solicitation for bids to explore solutions and prepare an investigative report, we would appreciate being included on the short list of potential companies to conduct the investigation.

Best Regards,

Tom Frese
