

In the Center for Aquiculture Research of Colombia (CENIACUA) is taking place a research to replace fish flour in the food for *Litopenaeus Vannamei*. To do this, they are using a vegetable flour cocktail and are evaluating in genetically selected families in order to estimate the diet X genotype interaction, and in this way select in the future shrimp able to better utilize vegetable protein. This project is very interesting because uses nutrition tools as well as quantitative genetics tools in order to replace fish flour.

Jorge Arturo Suárez
Nutricion Director CENIACUA
